Declaration of AI assistance

Journal of Combinatorial Theory, Series B

Author-prepared disclosure; not an official publisher form or signature.

Manuscript. Unbounded strong-product ratios for the Grundy domination number

Human authors. Deep Bhattacharjee.

Claude through Claude Code assisted the original computations, finite Lean development and drafting. ChatGPT assisted the exact-support rank argument, two-field construction, all-parameter half-graph count and explicit footprints. OpenAI Codex assisted proof auditing, independent checks, organization, references and typesetting.

Human oversight. The submitting author stated on 25 October 2026 that the text is a mix of human-written and AI-generated material and that all parts have been checked and understood by a human. This records that author declaration. Human authors retain responsibility for mathematical accuracy, citations and the final version; AI systems are not human coauthors.

Verification scope. The Lean certificate verifies the original finite N=21 counterexample. The general unbounded-ratio theorem and all-parameter formula are written proofs, not a general Lean formalisation.

Supporting record. The separate AI_PROVENANCE.md identifies the documented tasks and tools. No unprovided model version, human signature, confidential transcript or journal approval is asserted.
